

# 2014 Kentucky Hybrid Corn Performance Test

Richard C. Kenimer, Ron W. Curd, and Chad Lee, Department of Plant and Soil Sciences

The objective of the Kentucky Hybrid Corn Performance Test is to provide relative performance estimates of hybrid seed corn sold in Kentucky. The test attempts to treat every hybrid similarly in an unbiased manner. Agronomic practices that meet or exceed university guidelines are implemented at each location.

## Presentation of Data

Complete 2014 data is presented for the tests across all locations and tests at each location. Two-and three-year averages for yield are included in each of the single location tables. Tables that include data over multiple years and/or from multiple locations provide a better indication of hybrid performance. If individual location data is used, it should be used in combination with a multiple location average. The multiple location tables present better estimates of hybrid yield ability than data gathered at a single location in one year.

Comparisons between yields and other characteristics of any two or more hybrids should be made only with data from one table at a time. Hybrids are grouped into Early, Medium, Late, and White tests based on relative maturity or trait characteristics. Hybrids are listed in order of grain yield. The yields of all hybrids likely

to yield as well as the highest-yielding hybrid are marked with a dark gray box. See *Hybrid Comparisons* and *Experimental Design and Mean Comparisons* sections for more detail.

## Testing Procedure

### Selection of Hybrids

The hybrids submitted for testing are those most likely to be available for sale in 2015. Representatives from seed companies select and nominate their own hybrids. They provide the seed Table 1 and identify the maturity and/or seed coat color.

### Location of Tests

The map below shows the test locations. The test sites were selected to represent different agro-climatic areas of Kentucky where corn is a major commodity. There were seven total tests from six locations across the state. Two of the seven tests were irrigated (Fulton and Christian counties). Fulton included a non-irrigated test as well. These hybrids are tested in environments and at times are subject to damage. In 2014, the White test at Webster County was lost from extensive deer damage. One Pioneer hybrid at two locations was killed by mistake. The Late corn test at the Fulton non-irrigated site had a large amount

of variability (high CV) and was not used in the overall analysis.

### Cultural Practices

Corn seed was planted no-till into soybean stubble at four locations and into tilled fields at the other three. Fertilizer was applied in accordance with each individual farmer's practices.

All test areas were treated with herbicide(s) and insecticide(s) supplemented by post emergence herbicide when necessary. Specific cultural treatment for each location is included in that location's table, which includes notes about the growing season.

### Experimental Design and Mean Comparisons

Each hybrid was grown in three replications at each location to sample uncontrollable variability within the field. Yields presented in the tables are averages of three replications at the test site; 2-year and 3-year means are averages of six and nine replications, respectively. A randomized complete block design (RCBD) was used for each maturity group test at each location.

These tests are designed to predict relative yield ability. In these tests, we are most interested in how Hybrid A yields relative to Hybrid B. Slight differences in yield ability can occur as a result of vari-

### Yield Summaries and Weather Data

Summary Table	Location	Weather Table
2	State Summary	--
3	Caldwell County	4
5	Christian County—Irrigated	6
7	Fayette County	8
9	Fulton County—Irrigated	10
11	Fulton County—Rainfed	12
13	Larue County	14
15	Webster County	16

## Locations of the 2014 Kentucky Hybrid Corn Performance Tests

1. Caldwell County
2. Christian County
3. Fayette County
4. Fulton County
5. LaRue County
6. Webster County

<http://www.uky.edu/Ag/GrainCrops/varietytesting.htm>  
<http://www2.ca.uky.edu/cornvarietytest/>

ability in the field. The least significant difference (LSD) is used to account for that variability and to help determine significant differences between hybrid performances.

Consider the following example:

Hybrid	Yield
A	165
B	155
C	140
LSD (0.10)	12

The yield difference between Hybrid A and Hybrid B is 10 bu/acre ( $165 - 155 = 10$ ). The difference is less than the LSD (12 bu/acre). Based on the LSD, the yield difference between hybrids A and B is not significant, meaning that we would expect hybrids A and B to have the same yield capability the next season. However the yield difference between hybrids A and C is 25 bu/acre ( $165 - 140 = 25$ ) which is greater than the LSD (12 bu/acre). The LSD indicates that we would expect hybrid A to have greater yield capability than hybrid C next year.

The LSD occurs at the bottom of each table. Yield differences that are less than the LSD are not significantly different from each other. Tables are sorted from greatest to least yield. Cells that have been shaded gray are not significantly different from the highest yield mean in that column. The analysis indicates that all hybrids with yields shaded gray, would be expected to have similar yield potential next season.

The coefficient of variation (CV) is a calculated value that helps indicate unexplained variation in these studies. A smaller CV indicates less unexplained variation and more precise results.

### Planting

All plots were planted with a John Deere Maxi-Emerge vacuum, two-row, no-till planter modified for small plot work. Two-row plots are suitable for comparing performance of hybrids to one another. Each hybrid seed was planted into plots consisting of two rows 30 inches apart and 22 feet long. Hybrid seed was planted at the following rates by county:

Site	County	Rate
1	Caldwell	28,000
2	Christian	36,000
3	Fayette	32,000
4	Fulton (both plots)	28,000
5	Larue	32,000
6	Webster	32,000

## Harvesting

All plots were harvested with a Wintersteiger Delta two-row corn combine. Both rows of each two-row plot were harvested. The grain weight, moisture content, and test weight of grain from each plot was measured with an electronic scale and moisture meter mounted on the combine. Yields were calculated for grain at 56 pounds per bushel and adjusted to 15.5 percent moisture. The test weight reported in each annual table for any hybrid is not corrected for harvest moisture and is reported at the moisture content for that hybrid listed in that table. Dropped ears were not gleaned from the plots.

The total number of lodged plants was recorded at harvest. Christian County had an abnormally large amount of lodging. This is mainly due to green snap from a storm system that moved through in late July.

The Kentucky Hybrid Corn Performance Test is divided into four tests: Early, Medium, Late maturities and White hybrids. These divisions provide evaluations of the hybrid groups without competition biases. The divisions do not allow for comparisons across groups. For example, a hybrid in the Early test cannot be compared to a hybrid in the Late. The Early, Medium, Late and White tests were grown at all seven locations for a total of 28 tests.

- The Early maturity hybrid group in Table 2E and all subsequent "E" tables, includes those hybrids rated by the parent seed company to mature in 111 days or earlier.
- The Medium maturity hybrid group in Table 2M and all subsequent "M" tables includes those hybrids rated by the parent seed company to mature in 112-115 days.
- The Late maturity hybrid group in Table 2L and all subsequent "L" tables include those hybrids rated by the parent seed company to mature in 116 days or later.
- The White hybrid group in Table 2W and all subsequent "W" tables includes those hybrids with a white seed coat and rated by the parent seed company to mature in 112 to 117 days.

Grain moisture of hybrids in the Early, Medium, and Late tests should be within the LSD for that test. Hybrids with grain moisture above the LSD likely belong in a later-maturing test. Each hybrid is placed

in the Early, Medium, and Late tests based on the hybrid maturity defined by the company.

## Acknowledgments

The authors sincerely appreciate efforts of the Kentucky Corn Growers Association in providing a Wintersteiger Delta Corn plot combine through a very reasonable lease agreement. This combine contributes to improved accuracy of the data.

The authors are grateful to the following farmer-cooperators who not only provided land for testing but helped with the tests throughout the growing season:

- John Young and family of Herndon, Ky.
- Carlos Tucker and family of Sonora, Ky.
- Rob Garrigan and family of Hickman, Ky.
- Tapp Family Farms of Sebree, Ky.

The authors give special thanks to Ted Walker, John Stanhope and the entire crew of the College of Ag Farm Shop for keeping us going year-round.

Additional acknowledgments are made to the following people who helped conduct this year's performance test.

- Dr. Carrie Knott, Extension Specialist in Grain Crops, Research and Extension Center, Princeton, Ky.
- Joe Williams, Superintendent, and Scott Peek, Farm Manager, Research and Education Center, Princeton, Ky.
- Andrew Sosby and Trey Young, temporary help in 2014.
- Laura Jane Phelps, student from the University of Kentucky
- Mark Thomas, local Pioneer representative for supplying seed for borders
- Ben Mullins, Adult Ag Instructor, Fulton/Hickman Counties, KCTCS
- Jay Stone, Extension Agent, Christian County, Ky.
- Vicki Shadrick, Extension Agent, Webster County, Ky.
- David Harrison, Extension Agent, Larue County, Ky.

## Source of Seeds

The seeds planted in the 2014 Hybrid Corn Performance Test were acquired from the sources listed in Table 1.
