

2016 Kentucky Hybrid Corn Performance Test

Richard C. Kenimer, Brandon E. Roberts, Ronald W. Curd, and Chad Lee, Plant and Soil Sciences

The objective of the Kentucky Hybrid Corn Performance Test is to provide relative performance estimates of hybrid seed corn sold in Kentucky. The test attempts to treat every hybrid similarly in an unbiased manner. Agronomic practices that meet or exceed university guidelines are implemented at each location.

Presentation of Data

Complete 2016 data is presented for the tests across all locations and tests at each location. Two- and three-year averages for yield are included in each of the single location tables. Tables that include data over multiple years and/or from multiple locations provide a better indication of hybrid performance. If individual location data is used, it should be used in combination with a multiple location average. The multiple location tables present better estimates of hybrid yield ability than data gathered at a single location in one year.

Comparisons between yields and other characteristics of any two or more hybrids should be made only with data from one table at a time. Hybrids are grouped into Early, Medium, Late, and White tests based on relative maturity or trait characteristics. Hybrids that are likely to yield as high as the highest yielding hybrid, based on statistical evaluation, are shaded gray. See Hybrid Comparisons and Experimental Design and Mean Comparisons sections for more detail.

Testing Procedure

Selection of Hybrids

The hybrids submitted for testing are those most likely to be available for sale in 2017. Representatives from seed companies select and nominate their own hybrids. They provide the seed listed in Table 1 and identify the maturity and/or seed coat color.

List of Tables

Hybrids Tested	Table 1	Location --	Weather Table --
Yield Summary Tables	2 3 5 7 9 11 13 15	State Summary Caldwell County Christian County—Irrigated Fayette County Fulton County—Irrigated Fulton County—Rainfed Hardin County Webster County	-- 4 6 8 10 12 14 16

Location of Tests

The map on Page 1 shows the test locations. The test sites were selected to represent different agro-climatic areas of Kentucky where corn is a major commodity. There were seven total tests from six locations across the state. Included in these seven tests were two irrigated tests in Fulton and Christian counties. Both of these two were under center pivot irrigation. Furthermore, Fulton County had two tests, one irrigated and one non-irrigated both in the same field.

Seasonal Notes

There were many challenges this year due to the weather. Early on, the Early and Medium tests at Christian County had to be excluded. After harvest, the Late test in Christian County as well as the Medium test under irrigation in Fulton County had to be excluded, too. All of these were excluded due to excessive rainfall early on, which led to a very high CV in the two that were harvested.

Cultural Practices

Corn seed was planted no-till into soybean stubble at four locations and into a tilled field at the other three. Fertilizer was applied in accordance with each individual farmer's practices.

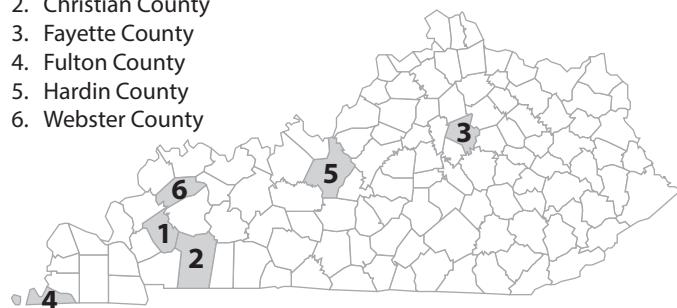

All test areas were treated with herbicide(s) and insecticide(s) supplemented by post emergence herbicide when necessary.

Experimental Design and Mean Comparisons

Each hybrid was grown in three replications at each location to sample uncontrollable variability within the field. Yields presented in the tables are averages of three replications at the test site; 2-year and 3-year means are averages of six and nine

Locations of the 2016 Kentucky Hybrid Corn Performance Tests

replications, respectively. A randomized complete block design (RCBD) was used for each maturity group test at each location.

These tests are designed to predict relative yield ability. In these tests, we are most interested in how Hybrid A yields relative to Hybrid B. Slight differences in yield ability can occur as a result of variability in the field. The least significant difference (LSD) is used to account for that variability and to help determine significant differences between hybrid performances.

Consider the following example:

Hybrid	Yield
A	165
B	155
C	140
LSD (0.10)	12

The yield difference between Hybrid A and Hybrid B is 10 bu/acre ($165 - 155 = 10$). The difference is less than the LSD (12 bu/acre). Based on the LSD, the yield difference between hybrids A and B is not significant, meaning that we would expect hybrids A and B to have the same yield capability the next season. However the yield difference between hybrids A and C is 25 bu/acre ($165 - 140 = 25$) which is greater than the LSD (12 bu/acre). The LSD indicates that we would expect hybrid A to have greater yield capability than hybrid C next year.

The LSD occurs at the bottom of each table. Yield differences that are less than the LSD are not significantly different from each other. Tables are sorted from greatest to least yield. Cells that have been shaded gray are not significantly different from the highest yield mean in that column. The analysis indicates that all hybrids with yields shaded gray, would be expected to have similar yield potential next season.

The coefficient of variation (CV) is a calculated value that helps indicate unexplained variation in these studies. A smaller CV indicates less unexplained variation and more precise results.

Planting

All plots were planted with a Wintersteiger Dynamic Disk vacuum, four-row, no-till planter, which is specialized for small plot work. Each hybrid seed was planted into plots consisting of four rows 30 inches apart and 20 feet long. Hybrid

seed was planted at a rate of 32,000 in the non-irrigated locations and at 36,000 at the irrigated locations.

Harvesting

All plots were harvested with a Wintersteiger Delta two-row corn combine. The central two rows of each four-row plot were harvested. The grain weight, moisture content, and test weight of grain from each plot was measured with an electronic scale and moisture meter mounted on the combine. Yields were calculated for grain at 56 pounds per bushel and adjusted to 15.5 percent moisture. The test weight reported in each annual table for any hybrid is not corrected for harvest moisture and is reported at the moisture content for that hybrid listed in that table. Dropped ears were not gleaned from the plots. The total number of lodged plants was recorded at harvest.

The Kentucky Hybrid Corn Performance Test is divided into four tests: Early, Medium, and Late maturities and White hybrids. These divisions provide evaluations of the hybrid groups without competition biases. The divisions do not allow for comparisons across groups. For example, a hybrid in the Early test cannot be compared to a hybrid in the Late. The Early, Medium, Late, and White tests were grown at all seven locations for a total of 28 tests.

The Early maturity hybrid group in Table 2E and all subsequent "E" tables, includes those hybrids rated by the parent seed company to mature in 111 days or earlier.

The Medium maturity hybrid group in Table 2M and all subsequent "M" tables includes those hybrids rated by the parent seed company to mature in 112-115 days.

The Late maturity hybrid group in Table 2L and all subsequent "L" tables include those hybrids rated by the parent seed company to mature in 116 days or later.

The White hybrid group in Table 2W and all subsequent "W" tables includes those hybrids with a white seed coat and rated by the parent seed company to mature in 112 to 117 days.

Grain moisture of hybrids in the Early, Medium, and Late tests should be within the LSD for that test. Hybrids with grain moisture above the LSD

likely belong in a later-maturing test. Each hybrid is placed in the Early, Medium, and Late tests based on the hybrid maturity defined by the company.

Acknowledgments

The authors sincerely appreciate efforts of the Kentucky Corn Growers Association in providing a Wintersteiger Delta Corn plot combine through a very reasonable lease agreement. This combine contributes to improved accuracy of the data.

The authors are grateful to the following farmer-cooperators who not only provided land for testing but helped with the tests throughout the growing season:

- John Young and family of Herndon, Ky.
- Kerby Grey and family of Cecilia, Ky.
- Sanger Farms of Hickman, Ky.
- Tapp Family Farms of Sebree, Ky.

The authors give special thanks to Ted Walker, John Stanhope and the entire crew of the College of Ag Farm Shop for keeping us going year-round.

Additional acknowledgments are made to the following people who helped conduct this year's performance test.

- Dr. Carrie Knott, Extension Specialist in Grain Crops, Research and Education Center, Princeton, KY.
- Dr. Carl Bradley, Extension Plant Pathologist, Research and Education Center, Princeton, KY.
- Joe Williams, Superintendent, and Scott Peek, Farm Manager, Research and Education Center, Princeton, KY.
- Nick Dillender, Blake Denson, Andrew Gennett, Connor Raymond student help in 2016.
- Mark Thomas, local Dupont Pioneer representative for supplying seed for borders
- Ben Rudy, Extension Agent, Fulton County, KY
- Jay Stone, Extension Agent, Christian County, KY.
- Vicki Shadrick, Extension Agent, Webster County, KY.
- Matt Adams, Extension Agent, Hardin County, KY.

Source of Seeds

The seeds planted in the 2016 Hybrid Corn Performance Test were acquired from the sources listed in Table 1.
